THE PERFECT CONDITIONS WITH COMFORTCLIMATE S

The ComfortClimate S infill supplement ensures the best possible conditions on the field of play in high temperatures. During summer, the temperature of the playing surface can be lowered by up to 10 °C and any warming of the system as a whole can be effectively delayed through hot spells. The turf should be watered to ensure cooling is effective. This approach, combined with the CoolPlus functionality of Polytan turf filaments, ensures effective cooling of synthetic turf.

ENVIRONMENTALLY FRIENDLY AND SUSTAINABLE

The ComfortClimate S supplement contains no chemical additives and is based on a natural raw material. So you can use it on the turf surface without any worries. The effect produced lasts a long time (1–2 years depending on intensity of use) and represents an economical solution compared with systems where turf is heated.

AREAS OF USE

- Can be mixed with Bionic Fibre / EPDM ST
- Interspersion quantity approx. 2 kg/m²
- ComfortClimate S is only suitable for systems filled with sand and rubber

Grain size: 0,5 – 1 mm
